Four Major Ways International Trade Has Changed Over the Past One Hundred Years

By Bennett O’Brien  1/13/2015

The past one hundred years have brought about incredible changes in nearly every industry and area of society. International trade is no exception. The way that business is done on a global level is now faster, more efficient, more reliable, and simply better.

So, what are the key differences between international trade now and international trade one hundred years ago?

1. Better domestic and international transportation

   In 1915, rail, ships, and horse and carriage were the main forms of transportation, and the period of the automobile was just beginning. The Ford Model T had only started production seven years earlier, in 1908. Before that, there were less than 200,000 cars on the road. Automobiles were therefore only just beginning to become an option for business travel.

   To further highlight the simple beginnings of the period of the automobile, the first paved concrete highway wasn’t created until 1909. There was a speed limit of 20 miles per hour on most roads, drivers weren’t required to have insurance or pass a drivers test until 1934, and there were no electric traffic lights until 1934. Just imagine trying to drive to an important business meeting on roads with no traffic lights or lines down the middle, filled with uninsured, unlicensed drivers. Furthermore, up until 1921, windshield wipers had to be operated manually by continually pulling a lever while driving!

   Along with personal transportation, the ways in which goods are shipped have been revolutionized over the past century. In 1896, the first truck was invented. It had a four horsepower, two-cylinder engine that could haul 3,300 pounds, and it only traveled 7.5 miles per hour. Today, tractor trailers are continually used to move products around and they have become an important part of the shipping industry. Tractor trailers can carry up to 80,000 pounds and can travel over 80 miles per hour (although this isn’t advised).

In addition to automobiles, planes, trains and ships have also come a very long way since 1915. Up until the late 1890s, many of the ships transporting cargo over long distances were still sail-powered. They could take literally weeks to cross the Atlantic, and weren’t completely replaced until around 1900, after which steam-powered ships capable of travelling much faster and carrying far more, took over.

Businesses can now move their products and supplies across long distances at a mere fraction of what it would have cost in the past. There are also newer, better shipping containers, improved ports in cities all over the world, and supertankers that can carry massive amounts of shipping containers—the largest of which can carry over 19,000 standard containers. These developments keep international trade bustling throughout the world.

2. Advancements in communications, logistics, and supply chain technologies

The technological advances that have occurred in the last century have been remarkable. From the Internet, to the credit card, to the bar code scanner, to the handheld calculator, incredible inventions made in the last one hundred years have completely changed the ways in which business is done. Just imagine trying to complete your trade finances in 1915 without access to a calculator!

Because of the Internet, it’s now possible to communicate instantly with clients thousands of miles away. You can even see them because of video chatting. Also, documents can be emailed and sent across these distances with just a few clicks.

Canadian companies can complete transactions with Chinese companies without ever having to send employees to China. There are also a number of language translation services available, such as Google Translate and iTranslate, to help people understand different languages.

Further, because of improvements in navigation, companies can now track shipments through GPS (global positioning system) satellites. They can watch their products or their supplies travel across oceans via their computers. This would have been completely unthinkable in 1915.

3. Improved political relations and more open trade

In the wake of two world wars and measures used to combat the Great Depression of the 1930s, many nations began working more closely to maintain peaceful relations and increase opportunities for international trade.

As a result, many organizations were formed in the 1940s and afterward, such as the United Nations, the World Bank and the World Trade Organization, to aid the process. These international organizations help to settle disputes and keep things balanced in the global marketplace.

The World Bank, for example, has grown from 43 country members in 1948 to 188 members today. The WTO (World Trade Organization) has also expanded from the 23 nations that first signed the General Agreement on Trade and Tariffs in 1947 and the
123 nations that established the WTO in its present form in 1995 to the 160 members it currently has today.

Though war, embargos and protectionist policies remain a part of the global environment, the work these and other organizations have performed over the past several decades has created a global environment allows more free, peaceful and beneficial international trade.

4. Increased ability to maximize a company’s global potential

Due to the advances in transportation, technology and geo-political relations, companies are now able to maximize and expand their potential in ways that wouldn’t have been possible in the past.

Today, it’s quite common for international companies to have their headquarters in one country, their manufacturing based in another, and then sell their products in many other nations across the world. For example, Apple Inc. has its headquarters in Cupertino, California, but it does a large amount of its manufacturing in China, and it sells products in countries all over the world, from Australia, to Brazil, to Switzerland.

Because supply lines can be optimized and communication is instantaneous and reliable across vast distances, companies are free to use the resources of different countries to maximize their growth and success.

For example, the United States is a massive global market, but many companies choose not to locate their manufacturing there because it has a higher minimum wage and more extensive labor regulations than many other nations.

So because of all the developments in international business, companies can now take advantage of what different countries have to offer to increase their profit margin.

**Article Questions**

Answer the following questions in the “Movement” tab of your 5 Themes of Geography foldable.

1. Why is international trade important in our world? (at least 2 sentences)

2. Using the article, list innovations/advancements that have benefitted the movement of goods in our world. (at least 5 examples)

3. How would the developments discussed in the article help with the movement of ideas across countries and cultures? (at least 2 sentences)

4. Which advancement in international trade do you think had the most impact on the world? Why? (at least 3 sentences)
