What is a Region?

Think about where you live, where you go to school, and where you shop. These places are all part of your neighborhood. In geographic terms, your neighborhood is a region. A region is an area that has common features that make it different from surrounding areas.

What regions do you live in? You live on a continent, in a country, and in a state. These are all regions that can be mapped.

Regions can be divided into smaller regions called subregions. For example, Africa is a major world region. Africa’s subregions include North Africa, West Africa, East Africa, central Africa, and southern Africa. Each subregion can be divided into even smaller subregions.

Regional Characteristics Regions can be based on physical, political, economic, or cultural characteristics. Physical regions are based on Earth’s natural features, such as continents, landforms, and climates. Political regions are based on countries and their subregions, such as states, provinces, and cities. Economic regions are based on money-making activities such as agriculture or industries. Cultural regions are based on features such as language, religion, or ethnicity.

East Africa is a subregion of Africa. It is an area of plateaus, rolling hills, and savanna grasslands.
Regional Boundaries All regions have boundaries, or borders. Boundaries are where the features of one region meet the features of a different region. Some boundaries, such as coastlines or country borders, can be shown as lines on a map. Other regional boundaries are less clear.

Transition zones are areas where the features of one region change gradually to the features of a different region. For example, when a city's suburbs expand into rural areas, a transition zone forms. In the transition zone, it may be hard to find the boundary between rural and urban areas.

Types of Regions There are three basic types of regions. The first is a formal region. Formal regions are based on one or more common features. For example, Japan is a formal region. Its people share a common government, language, and culture.

The second type of region is a functional region. Functional regions are based on movement and activities that connect different places. For example, Paris, France, is a functional region. It is based on the goods, services, and people that move throughout the city. A shopping center or an airport might also be a functional region.

The third type of region is a perceived region. Perceived regions are based on people's shared feelings and beliefs. For example, the neighborhood where you live may be a perceived region.

The three basic types of regions overlap to form complex world regions. In this textbook, the world is divided into nine major world regions (see map above). Each has general features that make it different from the other major world regions. These differences include physical, cultural, economic, historical, and political features.

Understanding What You Read

1. Regions can be based on what types of characteristics?
2. What are the three basic types of regions?
